

A METHOD OF SELECTING TARGETS AND GENERATING  
FEEDBACK IN OBJECT TRACKING SYSTEMS

ABSTRACT OF THE DISCLOSURE

5           A system initiates an object tracking system,  
magnifies the image, selects an object of interest in an  
image, and designates the object as the target all while  
the object tracking system is activated. In this manner  
it is easier for the user of the object tracking system  
10 to select the target, especially if the target tends to  
be moving fast.
